ABSTRACT

10 A process for producing oils with high viscosity indices from oil distillates or effluents from
a conversion unit comprises the following steps:

- 0044505 08440
15
- a) catalytic hydrotreatment of the feed in the presence of hydrogen and a non zeolitic catalyst;
 - b) fractionation of at least a portion of the effluent from step a) or step d) described below to an oil residue;
 - c) fractionation by thermal diffusion of at least a portion of the oil residue obtained from step b) into oil fractions with different compositions and viscosity indices.

Step b) can be preceded by a step d) for hydrocracking the effluent obtained from step a) in the presence of hydrogen and a zeolitic catalyst.

Figure 1 to be published.
